1 The Rational Numbers

The set $\mathbb Q$ of rational numbers is defined by $\mathbb Q=\{(p,q)\mid p,q\in\mathbb Z\text{ and }q\neq 0\}$. Then, for two elements $(p_1,q_1),(p_2,q_2)\in\mathbb Q$ we can have

Definition of equality:

$$(p_1, q_1) = (p_2, q_2)$$
 if, and only if $p_1q_2 = p_2q_1$

Definition of operations

- Addition(+): $(p_1, q_1) + (p_2, q_2) = (p_1q_2 + p_2q_1, q_1q_2)$
- Additive inverse(-): -(p,q) = (-p,q)
- Multiplication(·): $(p_1, q_1) \cdot (p_2, q_2) = (p_1 p_2, q_1 q_2)$
- Multiplicative inverse(()⁻¹): $(p,q)^{-1} = (q,p)$ if $p \neq 0$

A function $\phi:\mathbb{Z}\to\mathbb{Q}$ is defined as $\phi(x)=(x,1)$. Then we can have

- $\phi(x+y) = (x+y,1) = (x\cdot 1 + y\cdot 1, 1\cdot 1) = (x,1) + (y,1) = \phi(x) + \phi(y)$
- $\phi(-x) = (-x, 1) = -(x, 1) = -\phi(x)$
- $\phi(x \cdot y) = (x \cdot y, 1) = (x \cdot y, 1 \cdot 1) = (x, 1) \cdot (y, 1) = \phi(x) \cdot \phi(y)$
